

PROJECT DEMONSTRATION

Implement Client Script & UI Policy (Incident)

ServiceNow Administrator Project

Team Members

M Manisha (Leader)

M Sree Varshini

1. Demonstration Objective

The purpose of the project demonstration is to present the completed ServiceNow Incident-based implementation in a clear and systematic manner. The demonstration should show the project idea, the configured Client Script and UI Policy, the Incident form, the execution process, and the final user-facing behavior. The demo should provide practical evidence that the configured components are available in the ServiceNow environment and can be demonstrated through the Incident interface.

2. Demo Requirements

Requirement	Details
ServiceNow Instance	Working ServiceNow environment with access to the Incident module.
Project Configuration	Configured Client Script and UI Policy related to the Incident table.
Screen Recording	Screen sharing must clearly show the ServiceNow interface and configuration/execution steps.
Voice-over	Explain each major step while demonstrating the project.
Final Output	Show the resulting Incident form behavior after the configured condition/action is applied.

3. Suggested Video Structure

Section	What to Demonstrate	Suggested Time
Introduction	Project title, team and short project overview.	30–45 sec
Purpose	Problem addressed and purpose of Client Script & UI Policy.	45–60 sec
ServiceNow Setup	Open the ServiceNow environment and Incident module.	30–45 sec
Client Script	Show the configured Client Script and explain its settings.	1–2 min
UI Policy	Show the configured UI Policy and explain its settings/actions.	1–2 min
Execution	Demonstrate the Incident form before and after the condition/action.	1–2 min
Final Output	Show the completed behavior and summarize the result.	45–60 sec
Conclusion	Benefits, learning outcome and closing statement.	30–45 sec

4. Introduction Script

Suggested voice-over: “Good morning/afternoon. Our project is titled *Implement Client Script & UI Policy (Incident)* using ServiceNow. This project demonstrates how Client Script and UI Policy can be

used to control and improve the behavior of an Incident form. The objective is to provide a more controlled and user-friendly Incident management experience through configuration in ServiceNow."

5. Project Purpose and Benefits

During the demonstration, explain that Client Scripts and UI Policies are used to control form behavior according to configured requirements. The project focuses on the Incident table and demonstrates how configuration can make form interaction more organized and consistent. The benefits to mention include improved form behavior, better control over user interaction, reduced unnecessary input, improved consistency, and easier administration of Incident forms.

6. ServiceNow Incident Module Demonstration

Step	Demonstration Action
1	Open the ServiceNow instance and sign in using the project account.
2	Navigate to the Incident module.
3	Open an existing Incident or create a new Incident for demonstration.
4	Show the relevant Incident fields before the configured condition/action is triggered.
5	Explain which field or form condition is relevant to the project implementation.
6	Trigger the configured condition and observe the form behavior.

7. Client Script Demonstration

Open the configured Client Script from the appropriate ServiceNow configuration area. Show the script name, table, script type, UI type, active status, condition or triggering logic, and the script body. Explain each setting using the actual configuration created by the team. The exact field names, conditions and JavaScript statements should be read directly from the implemented ServiceNow configuration during recording rather than replaced with assumed values.

Voice-over guide: "Here we are showing the Client Script configured for the Incident table. This configuration is responsible for applying the required client-side behavior when the defined condition or form event occurs. We will now demonstrate the same behavior from the Incident form."

8. UI Policy Demonstration

Open the configured UI Policy and show its name, table, active status, condition, and UI Policy Actions. Explain how the configured policy affects the relevant Incident field or fields. The demonstration should use the actual settings from the completed ServiceNow project. Do not introduce a different condition or action that is not part of the team's implementation.

Voice-over guide: "This is the UI Policy configured for our Incident form. The policy checks the configured condition and applies the defined UI Policy Action. We can now verify the effect directly on the Incident form."

9. Before → Action → After Demonstration

Stage	What to Show
Before	Show the Incident form in its normal state before the relevant condition is triggered.
Action	Change/select the actual field value or perform the actual form action required by the project condition.

Stage	What to Show
Processing	Allow the Client Script/UI Policy configuration to execute.
After	Show the actual field behavior produced by the implementation.
Verification	Confirm that the displayed behavior matches the configured requirement.

10. Final Output Explanation

At the end of the execution, keep the Incident form visible and clearly show the final behavior. Explain what changed, why the change occurred, and how the Client Script and/or UI Policy contributed to the result. The final output should be demonstrated from the actual project instance so that the recording acts as evidence of implementation.

11. Conclusion Script

Suggested voice-over: “This completes our demonstration of the Client Script and UI Policy implementation for Incident management in ServiceNow. Through this project, we demonstrated configuration, form behavior, execution and validation. The implementation helps provide controlled and consistent interaction within the Incident form. Thank you for watching our project demonstration.”

12. Recording Checklist

- Project title is clearly introduced.
- Team members are mentioned.
- Project purpose is explained.
- ServiceNow screen is shared clearly.
- Incident module/form is demonstrated.
- Client Script configuration is shown.
- UI Policy configuration is shown.
- Actual condition/action is demonstrated.
- Before and after behavior is visible.
- Voice-over is clear and understandable.
- Final output is shown.
- Conclusion is included.
- No passwords or private credentials are visible in the recording.

13. Demo Video Submission

After recording, upload the completed project demonstration video to Google Drive. Set the sharing permission so that the required reviewers can access the video. The final Google Drive link should be added to the GitHub repository documentation and submitted through the required team/SkillWallet process. Before submission, open the shared link in a private/incognito browser window to confirm that the video can be viewed without requiring the owner's account.

14. GitHub Placement

Recommended location inside the project repository:

08-Project-Demonstration/

■■■ Project-Demonstration.pdf

■■■ Demo-Video-Link.txt

■■■ Demo-Screenshots/

The Demo-Video-Link.txt file can contain the final Google Drive URL after the video has been uploaded and its sharing permission has been verified.

15. Demonstration Outcome

The project demonstration provides a complete visual explanation of the implemented ServiceNow solution. It connects the project requirements with the configured Incident form behavior and provides evidence through screen recording. A successful demonstration should make it easy for a mentor or evaluator to understand what was configured, how it works, and what final result is produced.

17. Final Conclusion

The Project Demonstration phase completes the practical presentation of the ServiceNow Client Script and UI Policy project. By combining a structured explanation, live ServiceNow screen sharing, configuration walkthrough, and actual Incident form execution, the team can present the project in a professional and easy-to-follow manner. The final recording should focus on the team's actual implementation and should use the real configured values and observed output.
