

03 – Project Design

Client Script & UI Policy in ServiceNow Incident Management

Technology Track	ServiceNow Administrator
Module	Incident Management
Design Components	Incident Form, Client Script, UI Policy

1. System Design

The system design describes how the ServiceNow Incident form interacts with configured Client Script and UI Policy logic. When a user opens or changes values in the Incident form, the configured conditions are evaluated and the relevant field behaviour is applied.

Layer	Component	Purpose
User Layer	ServiceNow User	Opens and works with the Incident form.
Form Layer	Incident Form	Provides Incident fields and user input.
Logic Layer	Client Script	Provides client-side behaviour based on configured events and conditions.
Logic Layer	UI Policy	Controls field properties based on configured conditions.
Output Layer	Updated Incident Form	Displays the resulting dynamic field behaviour.

2. Workflow Design

The workflow follows the sequence: User opens the Incident form → selects or changes a field value → configured condition is checked → Client Script and/or UI Policy applies the configured behaviour → Incident form is updated.

Figure 1: Workflow showing the condition-based flow from the Incident form to Client Script/UI Policy and the updated form.

3. UI Design

The UI design represents the Incident form in different states to demonstrate how field behaviour changes according to the configured conditions.

UI Design – Incident Form

Client Script & UI Policy Implementation

Comments

Validation message is shown using Client Script when mandatory field is not filled.

Figure 2: UI design showing the default Incident form, condition-based field changes, and validation behaviour.

4. Client Script Design

- The Client Script is designed to provide client-side behaviour on the Incident form.
- It can respond to configured form events or field changes.
- The design supports condition-based field behaviour such as showing, hiding, setting values, or validating fields, according to the implemented project configuration.

5. UI Policy Design

- The UI Policy is designed to dynamically control field properties on the Incident form.
- The policy is applied when its configured condition is satisfied.
- UI Policy Actions are used to control the relevant field properties according to the project configuration.

6. Designed User Flow

Step	User / System Action	Result
1	User opens Incident form	Initial Incident form is displayed.
2	User selects or changes a field value	Configured condition is evaluated.
3	Condition is satisfied	Client Script / UI Policy behaviour is applied.
4	Field properties are updated	Relevant fields change according to configuration.
5	User continues with the form	Updated Incident form is available for further action.

Team Leader	M Manisha
Member	M Monisha
Member	E Pattu Devi
Member	S Selva Abi
Member	M Sree Varshini

8. Design Outcome

The project design provides a clear structure for implementing condition-based dynamic behaviour in the ServiceNow Incident form using Client Script and UI Policy.
