

05 – Project Development

Client Script & UI Policy in ServiceNow Incident Management

Technology Track	ServiceNow Administrator
Platform	ServiceNow
Module	Incident Management
Development Components	Client Script and UI Policy

1. Development Overview

This phase covers the implementation of the Client Script and UI Policy for the ServiceNow Incident form. The development should follow the conditions, field behaviour and configuration specified in the approved project requirements and design.

Implementation evidence: The exact Client Script condition, script code, UI Policy condition and UI Policy Actions must be recorded from the team's actual ServiceNow configuration. This document does not invent those configuration values.

2. Development Components

Component	Implementation Purpose	Evidence
Incident Form	Main form used for the project implementation.	Incident form screenshot
Client Script	Provides the configured client-side behaviour.	Client Script configuration screenshot + script
UI Policy	Controls configured field properties based on conditions.	UI Policy configuration screenshot + actions

3. Client Script Implementation

- Open the Client Scripts configuration in ServiceNow.
- Create the Client Script for the Incident table according to the approved project requirement.
- Configure the required script type, UI type, condition and client-side logic.
- Save the configuration and verify the behaviour from the Incident form.
- Capture screenshots of the configuration and the resulting form behaviour.

Client Script Configuration Record

Configuration	Actual Project Value
Name	To be filled from ServiceNow
Table	Incident
Type	To be filled from ServiceNow
UI Type	To be filled from ServiceNow
Condition	To be filled from approved project requirement
Script	Paste the actual implemented script here

4. UI Policy Implementation

- Open the UI Policies configuration in ServiceNow.
- Create the UI Policy for the Incident table according to the approved project requirement.
- Configure the required condition.
- Add the required UI Policy Actions for the relevant fields.
- Save the configuration and verify the field behaviour on the Incident form.
- Capture screenshots of the UI Policy, its actions and the resulting form behaviour.

UI Policy Configuration Record

Configuration	Actual Project Value
Name	To be filled from ServiceNow
Table	Incident
Active	To be filled from ServiceNow
Condition	To be filled from approved project requirement
UI Policy Actions	Record the actual configured field actions

5. Development Workflow

Step	Development Activity	Evidence
1	Open ServiceNow Incident module/form.	Screenshot
2	Configure Client Script.	Configuration screenshot
3	Configure UI Policy.	Configuration screenshot
4	Apply the configured conditions in the Incident form.	Execution screenshot
5	Verify dynamic field behaviour.	Before/after screenshot
6	Record final implementation result.	Final output screenshot

6. Development Evidence Checklist

- Incident form screenshot before configuration.
- Client Script configuration screenshot.
- Actual Client Script code saved in Client-Script.txt.
- UI Policy configuration screenshot.
- UI Policy Actions screenshot.
- Incident form screenshot after applying the condition.
- Final working output screenshot.

7. Team Members

8. Development Outcome

The development phase is complete when the required Client Script and UI Policy are configured in ServiceNow, the Incident form demonstrates the intended condition-based behaviour, and the implementation evidence is captured for testing and documentation.
