

02 – Requirement Analysis

ServiceNow Administrator Project

Project Title	Client Script & UI Policy in ServiceNow Incident Management
Technology Track	ServiceNow Administrator
Module	Incident Management

1. Requirement Overview

The requirement analysis identifies the requirements needed to implement Client Script and UI Policy in the ServiceNow Incident form. The requirements focus on controlling Incident form fields according to configured conditions and providing dynamic behaviour.

2. Functional Requirements

- The project should use the ServiceNow Incident form as the main working area.
- A Client Script should be configured for client-side behaviour on the Incident form.
- A UI Policy should be configured for dynamic field properties on the Incident form.
- Configured conditions should control the behaviour of relevant Incident form fields.
- The implementation should demonstrate the change in field behaviour when the applicable condition is met.
- The final Incident form should show the configured behaviour correctly.

3. Non-Functional Requirements

- The form behaviour should be clear and easy for users to understand.
- The implementation should reduce unnecessary manual actions.
- The configured behaviour should be consistent when the same condition is applied.
- The project should be documented with configuration details and screenshots.
- The final implementation should be demonstrable through a screen-recorded project demo.

4. Platform Requirements

Requirement	Description
Platform	ServiceNow
Module	Incident Management
Configuration	Client Script and UI Policy
Documentation	Project configuration details and screenshots
Demonstration	Screen sharing with voice-over and final output

5. Client Script Requirements

- Configure the Client Script on the Incident table/form.
- Define the appropriate client-side trigger or condition for the required behaviour.

- Implement the required client-side field behaviour.
- Verify the behaviour from the Incident form after the configuration is saved.

6. UI Policy Requirements

- Configure the UI Policy for the Incident form.
- Define the condition under which the policy should be applied.
- Configure the required UI Policy Actions for the relevant fields.
- Verify the field properties after the condition is satisfied.

7. User Requirements

- Users should be able to work with the Incident form without unnecessary manual field management.
- Users should receive the configured field behaviour automatically when the applicable condition is selected.
- The Incident form should remain understandable and easy to use.

8. Requirement-to-Feature Mapping

Requirement	ServiceNow Feature
Client-side form behaviour	Client Script
Dynamic field properties	UI Policy
Condition-based behaviour	Client Script / UI Policy
Reduced manual actions	Dynamic form behaviour
Verification of output	Incident form testing

9. Expected Requirement Outcome

After fulfilling these requirements, the ServiceNow Incident form should demonstrate the configured dynamic field behaviour through Client Script and UI Policy based on the selected conditions.
